

Connect to a File Server with a Specific Username (macOS)

To connect to an SMB file server using a different username, you can use this procedure:

1. In the Finder, choose the **Go** menu, then select **Connect to Server**.

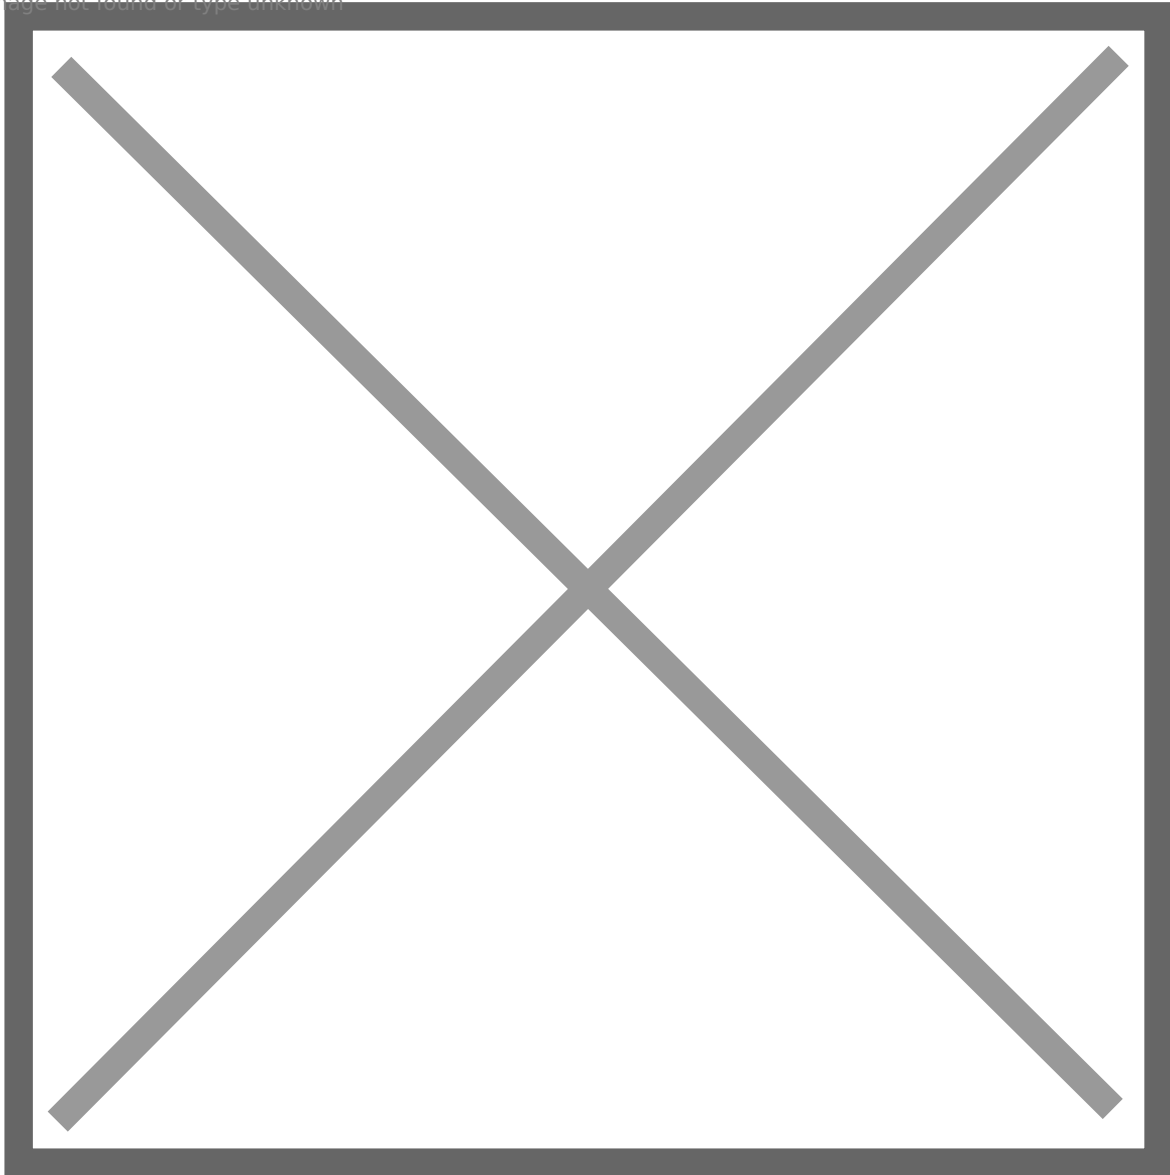

Image not found or type unknown

2. Type the network address for the computer or server in the **Server Address** field in the following format:

smb://username:*@server.name

Image not found or type unknown

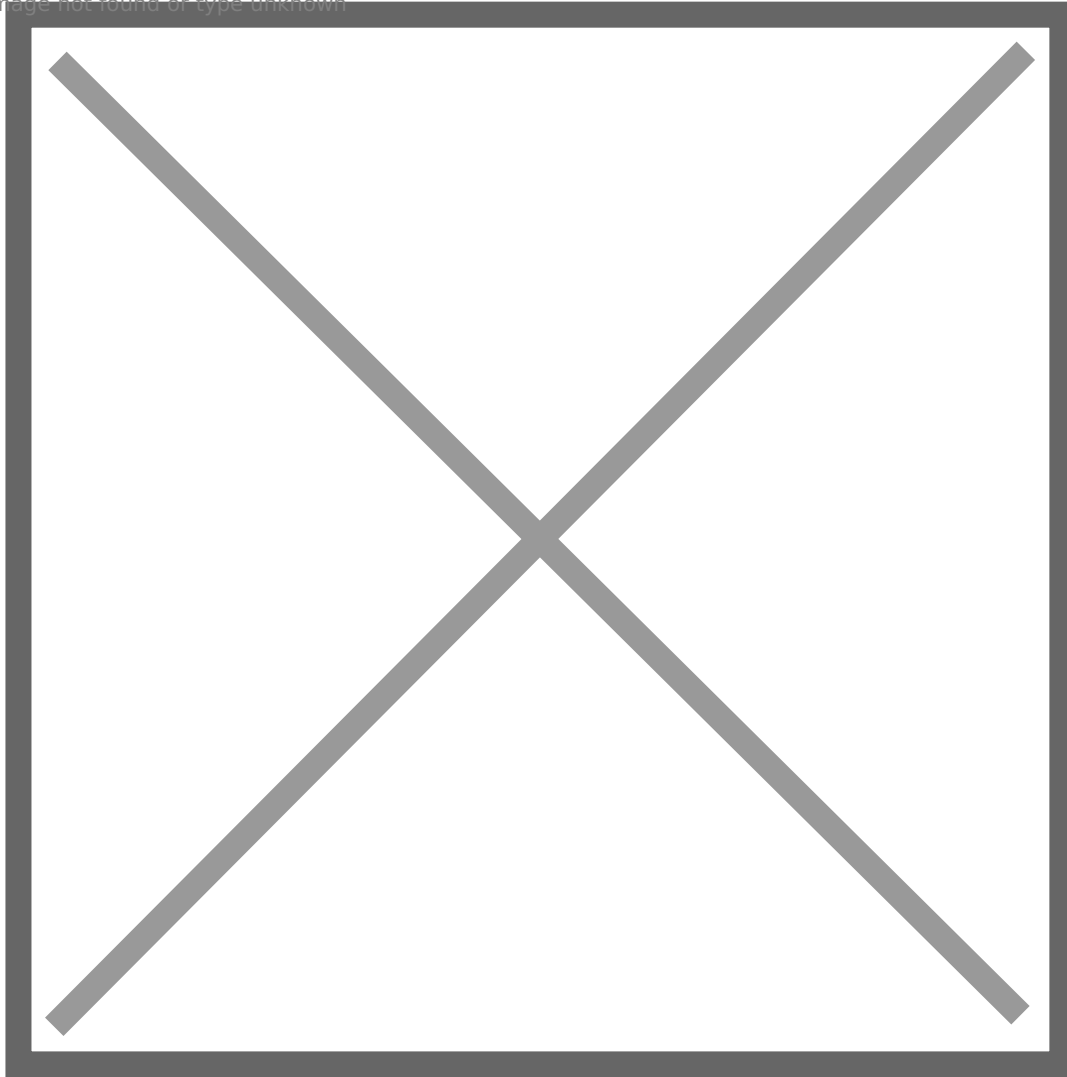

3. The " * " is to trigger the server login window for your SMB server, so that the password for the **username** account can be entered.
4. Click the **Connect** button.
5. Enter the desired username and password when prompted:

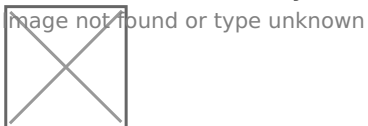

Username: *username*

Password: *The current account password for username*

Image not found or type unknown

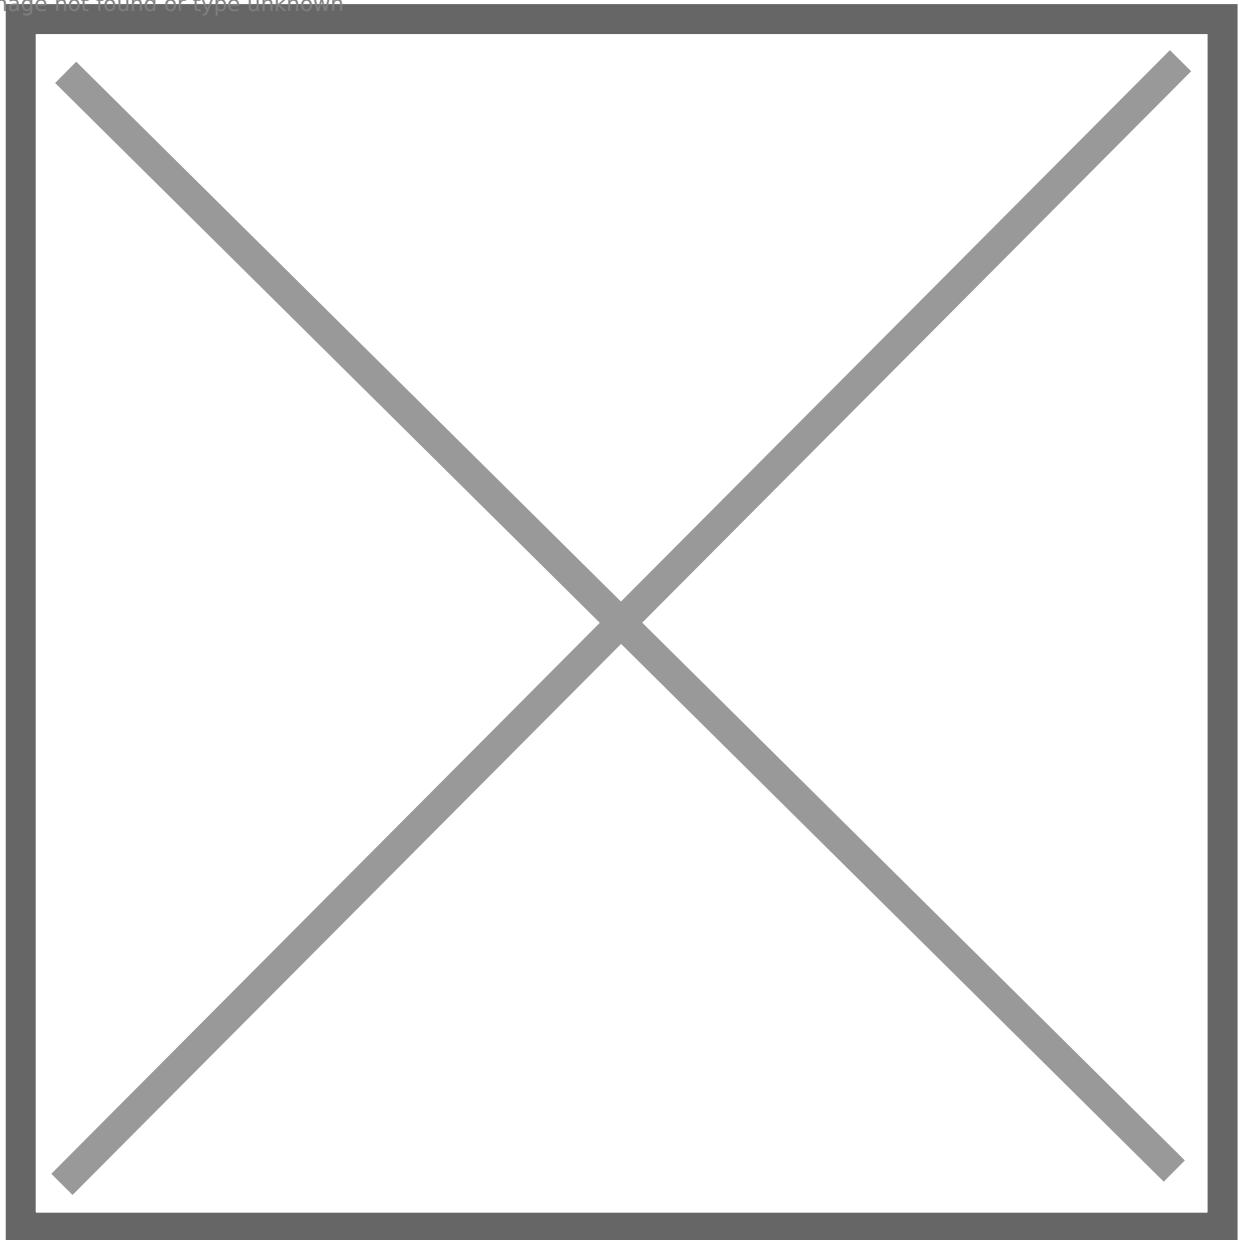

6. Select the share on your SMB server that you want to use.

WARNING: Do not try to mount the same share twice using different usernames. One way you can verify that you're actually connected using different usernames is to use the **mount** command in **Terminal**.

Image not found or type unknown

This should show all mounted volumes on the Mac, including mounted fileshares. The fileshare mount information should include which account was used to mount the share.
